

Health Information and Communication of Data:

Data profiling and social marketing campaigns supporting health equity and poverty reduction strategies

Dr. Cory Neudorf
Chief Medical Health Officer,
Saskatoon Health Region &
Associate Professor,
Univ. of Saskatchewan

Outline

- Background, definitions
- Role of information in policy making, program planning and decision making
- Local, regional and national examples:
 - Internal (Public Health)
 - Intra-sectoral (Health System)
 - Inter-sectoral (Human Service sector)
 - All-of-Government / HiAP

Context: Public Health in Canada

Context: a Population Health Approach for health system planning and delivery

- Definitions
 - Population health approach
 - Health Inequality
 - Health inequity
 - All of Government approach / Health in All Policies

What is Health Equity?

“implies that all people can reach their full health potential and should not be disadvantaged from attaining it because of their race, ethnicity, religion, gender, age, social class, [where they live], socioeconomic status or other socially determined circumstance”

Modified from Whitehead M, Dahlgren G. 2006. Concepts and principles for tackling social inequities in health: Levelling up part 1. Geneva: World Health Organization. (p. 5).
<http://nccdh.ca/resources/entry/concepts-and-principles-for-tackling-social-inequities-in-health>

Role of “Population Health”

- Population health – definition
- “focuses on improving the health status of a population, or sub-population rather than individuals. Focusing on the health of populations also necessitates the reduction of health inequalities in health status between population groups. An underlying assumption of a population health approach is that reduction in health inequalities require reductions in material and social inequities. The outcomes or benefits of a population health approach therefore extend beyond improved population health outcomes to include a sustainable and integrated health system, increased national growth and productivity, and strengthened social cohesion and citizen engagement.” *Public Health Agency of Canada*

Whole-of-Government Approach

- An approach that integrates the collaborative efforts of the departments and agencies of a government to achieve unity of effort toward a shared goal.
- When that shared goal is to maximize the health and well-being of the population, or to consider the health or determinants of health impact of the proposed policy before implementation, that is the start of a health in all policies approach...

Health in All Policies

- Is an approach to public policies across sectors that systematically takes into account the health and health systems implications of decisions, seeks synergies and avoids harmful health impacts, in order to improve health and health equity.
 - Founded on health related rights & obligations
 - Emphasizes the consequences of public policies on health determinants
 - Aims to improve accountability of policy-makers for health impacts at all levels of policy-making
 - Source: “Health in All Policies: Seizing opportunities, implementing policies. Leppo et al. 2013

Why Monitor Health Status and Health Inequities?

- To support intersectoral action on programs & policies
- To increase public awareness and support for policy change
- To support health system action on program & policy making

At local, regional and national levels....

Guiding Framework

World Health Organization. *A Conceptual Framework for Action on the Social Determinants of Health*. 2010.

Policy Entry Points

Health System Use of Health Equity Data

1. At the program/Department level:

- For planning and monitoring quality of disease prevention and health promoting programs and services

2. At the system planning / quality improvement level:

- For planning and monitoring quality of treatment and rehabilitative programs and services

3. At the Senior Leadership / Strategic level

- For planning and prioritizing health system programs and services

Levels of Data for Health Status & Health Equity reporting

- Individual:
 - Linkage studies
 - Primary data collection
- Aggregate:
 - Neighborhood or small area aggregate analysis based on underlying population demographics

Health Status Reporting

- Traditional uses (morbidity, mortality health behaviour reporting) and mandates in Public Health legislation for annual reports
- Evolution of health status reports in Saskatoon:
 - Expansion of indicators to include social determinants of health and many non-traditional indicators of health status
 - Inclusion of recommendations for Health system and other sector to improve population health
 - Trend toward shorter, more frequent topical reports
 - More consultation with target audiences to fine tune format and content
 - Consultations with stakeholders to assist in interpretation and analysis and dissemination and improve uptake/ownership
 - Move to web based interface with “drill down” for more detail as required (from infographics to one pagers with hypertext links to detailed tables and summary recommendations) see

www.communityview.ca/communityviews

Resources required for analysis and reporting

- Saskatoon Public Health Observatory – gradually built up over 15 years to current 12-14 staff including epidemiologists, GIS analyst, policy analyst, research assistants, knowledge transfer specialist, database analyst
- University partnerships and cross-appointments for population health intervention research

Health Status and health equity monitoring and reporting

Welcome to the CommunityView Collaboration

Our goal is to provide you with relevant, reliable, local information and evidence to inform your planning, decision-making, and policy for Saskatoon and surrounding area.

We bring together data from different human service sectors and community based organizations, and the many resources, projects, initiatives and research that are contributing to the well-being of Saskatoon.

Ultimately, through community collaboration, we are *Building Evidence for Action!*

Health Status Reports: Consistent Calls to Action

Sample consultation questions for health system leaders and managers

- Are there any barriers to access or uptake of services and facilities amongst any particular population group or area that you frequently encounter?
- Are there any already existing priorities for action that contribute to improve health equity?
- What programmes, services, approaches/practices already exist in your areas which might help in reducing gaps in equity?
- What further action is required from existing services or structures to address gaps in equity?
- How can health equity principles be embedded into existing work?
- Is more targeted action with specific groups and areas required?
- Are the supports and resources available in the system to adequately address health inequities in your area? What other resources would be helpful?

Health Disparity by Neighbourhood Income

Mark Lemstra, MSc, DSc¹

Cory Neudorf, MD, FRCPC, MHSc²

Johnmark Opondo, MD, MPH³

ABSTRACT

Background: Canadian cities are becoming more segregated by income. As such, investigation is required into the magnitude of health disparity between low-, average- and high-income neighbourhoods in order to quantify the level of health disparity at the scale of an urban city.

Methods: A cross-sectional ecological study design was used to review all hospital discharges, physician visits, medication utilization, public health information and vital statistics for an entire city by neighbourhood income status. Postal code information was used to identify six existing contiguous residential neighbourhoods in the city of Saskatoon that were defined as low-income cut-off neighbourhoods (N=18,228). There were two comparison groups: all other Saskatoon residents (N=184,284) and the five most affluent neighbourhoods in Saskatoon (N=16,683).

Many studies from different countries and diverse settings have found a strong correlation between life expectancy and socioeconomic status (SES).¹⁻⁵ Historically, most of the studies reviewing SES and health status are at the individual rather than the neighbourhood level.^{3,6-13} Recent studies suggest that neighbourhood SES can independently influence individual health above and beyond individual SES.⁹⁻¹³ As such, research on the independent effect of individual and neighbourhood SES on health status is fairly well documented. Although the previous research is very important, there are several considerations: 1) most peer-reviewed research is American or British, 2) most papers use national-level census data with analysis at the national or provincial level, 3) when national-level census data is broken down into regional data, the census tract boundaries can create proxies for neighbourhoods that might not be meaningful, 4) analysis at the regional level normally results in very small sample size, and 5) health information is normally

Health Issue	Rate Ratio Core : Rest of Saskatoon	Rate Ratio Core : Affluent

Interpreting Multiple Equity Measures

- To interpret multiple equity measures, a 7 step process was developed
- Gini coefficients were the primary focus and thus all indicators were first ranked according to that measure
- Disparity Rate Ratios, Rate Differences, and Rates per 1000 were also considered and ranked accordingly
- A composite score was created in consideration of the above measures
- Indicators were ranked in priority sequence according to composite scores and overall gini coefficient categories (high, medium, low inequality)
- Those with a high score and high gini coefficient have been given priority for stakeholder consultations

MATRIX SCORE

	Low Inequality (Gini score: <= 0.06)

* Data incomplete

^ T5 = 2011 for all indicators except Tuberculosis (2010) T5 = 2010 for all indicators (1997)

Population Projections

[▶ About the Data](#)[One Page Summary](#)

Our Region is expected to grow from 336,403 to 418,578 in 2030.

6 in 10 individuals in the Region rated their health as “very good” or “excellent” in 2012.

People living in the most advantaged areas of Saskatoon had the highest self-rated health.

Smoking rates in the Region decreased over time to 18% in 2012.

People living in the most advantaged areas of Saskatoon had the lowest smoking rates.

Gaps in Health Equity

[About the Data](#)[One Page](#)

Least Advantaged

Over the last 15 years in our Region, gaps in health equity have remained wide and persistent.

Most Advantaged

What would you do with 9 extra years?

Least Advantaged

Most Advantaged

Average life expectancy in 2007

76
years

unchanged since 1997

Average life expectancy in 2007

85
years

up from 82 years in 1997

The gap in life expectancy between those living in the most and least advantaged areas has increased over time in our Region.

- Recommendation #2)

Holistic approach for Improving Health and wellbeing of First Nations and Metis peoples: (Introduction contains)

- Awareness and acknowledgement of traditional lands and treaties in reports and meetings
- Asset-based approach in balance with discussing the current challenges in order to find the way forward

A Message from Dr. Cory Neudorf
Chief Medical Health Officer
Saskatoon Health Region

Our Vision of Better Health for All

The conditions in which we live, work, learn and play have a huge impact on our health. The stark reality is that many people who live in Saskatoon Health Region do not have the same opportunities to be as healthy as others and as a result, live shorter lives. This is not fair and does not need to be this way.

We can live in a community in which everyone has a chance to live a healthy life. Our community can be one in which everyone has the same opportunities to reach their full health potential and not be disadvantaged by their race, ethnicity, religion, gender, age, disability, sexual orientation, where they live, socioeconomic status or other socially determined circumstance.¹ Our community can be a place in which all families can afford the basics in life: where no child lives in poverty; where those who work receive a wage that allows them to purchase healthy foods and pay the rent; where First Nations and Métis people have greater self-determination² and no longer face institutionalized racism; and where people living with mental health conditions are supported and not stigmatized.

While I am encouraged by what we have achieved towards making this vision a reality, we must continue with our commitment to create greater positive change. There is already much support from the community.³ Let us use this momentum by continuing to work together as a community and build upon our collective strengths.

Health Equity-Integrated Health Status Reporting

How will we know when positive changes have occurred? Saskatoon Health Region's Public Health Observatory has significantly contributed to measuring the vision for health for over a decade through health equity integrated health status reporting and health disparity research. Gathering and analyzing data and consulting with key stakeholders about the health of our population provide the Region and its partners with important information that should in the short-term, create a burning desire for change and in the long-term, contribute to creating equal opportunities for all to make choices that lead to good health.

Over the coming months, in our *Better Health for All* series, we will

*Saskatoon Health
Region's commitment to
Better Health*

*Improve population
health through health
promotion, protection
and disease prevention,
and collaborating with
communities and
different government
organizations to close the
health disparity gap.*

Campaigns

- Move from full reports every 4 years with topical reports in between to regularly updated data, regular mini reports with periodic overview recommendations
- Presentations to Board, Intersectoral committee, government, media (public)
- Better uptake by media, board, decision makers, and media

Social marketing

- Social media (twitter, blogs, youtube videos, websites), advocacy, and letter writing to politicians, presentations to policy committee of government
- <http://www.povertycosts.ca/>
- <http://www.saskatoonpoverty2possibility.ca/>
- Target groups and content changed over time

Results (in Health sector)

Health Care Equity Audits: E.g. Immunization

Figure 4.3: Two Year Old Coverage Rate for Rubella and Measles (Two Doses), Saskatoon Health Region, 2003-2008

	2003	2004	2005	2006	2007	2008
Core Neighbourhoods	45.4	52.3	42.9	50.7	50.9	63.5
Non-Core Neighbourhoods	67.6	66.9	68.3	72.2	74.0	76.0
Rural SHR	74.7	73.3	73.5	72.9	73.7	81.6

Performance metrics with equity focus

DASHBOARD - FACT SHEET

IMMUNIZATION DISPARITY RATIO MUMPS MEASLES RUBELLA (MMR)

What is being measured?

Equity is defined as providing care on basis of need not influenced by personal characteristics and circumstance. Immunization disparity can be expressed as a ratio comparing the top socio-economic quintile to the bottom quintile. In other words, this compares the wealthiest fifth of our population to the poorest fifth.

The ratio is calculated by dividing the two year-old MMR coverage rate in the top socio-economic quintile by the coverage rate in the bottom quintile. **A ratio equal to one indicates equity while measures greater than one indicate inequity.**

Socio-economic quintiles are based on the Total Deprivation Index. This includes income, employment, education and social support indicators. It is calculated at the Dissemination Area level geography for Saskatoon city only, and cannot be utilized at present for rural SHR.

Immunization rates are calculated for populations in the top and bottom quintiles - 20% of the population.

Why is it important?

SHR has a mandate to reduce disparities based on the Federal Healthy Living Strategy. Health disparities make it difficult for individuals and groups to participate fully in society. Health disparities are also huge cost drivers which are estimated to account for 20% of all healthcare expenditures.

How are we doing?

The ideal disparity ratio is equal to 1.0, which indicates equality between the upper and lower quintiles or socio-economic groups of population (i.e. no gap). In SHR the disparity ratio has been decreasing most rapidly since 2007. This signals greater equity in immunization rates.

Our 2011-12 target was 1.16, and our Q4 ratio was 1.25. In January 2012, we initiated a targeted pilot campaign to address immunization rates in the lowest socioeconomic neighbourhoods and it has been successful in immunizing some of the hardest to reach families in Saskatoon. In 2012-13, our Community Program Builders will continue to make personal connections and reminders via home visits and phone calls with the hardest to reach families and neighbourhoods.

WE ASK BECAUSE WE CARE.

What are we asking?

We are asking all patients who register at this hospital whether they self-identify as First Nations or Métis.

You can choose not to answer this question.

Why are we asking?

Our goal is to make sure you have access to the highest quality of healthcare that we can provide. The information you provide will:

- Tell us more about you and help us connect you with services
- Help us plan for services
- Help us improve the quality of care for all.

Who will ask this question? When? Where?

This question will be asked when you register for your appointment or hospital stay at Registration Services. You will be asked this question when the Registration Clerk verifies and updates your personal information, such as your address, phone number, next of kin, and family physician.

What happens to the information we collect?

Your information may be seen by people in your 'circle of care' – your doctors, nurses, health navigator, and others involved in your care – and will be treated with the same respect and confidentiality as all the other information you share as part of your care and treatment. For research, program planning, and staff training purposes, the information will only be available in 'aggregate' form; this means that your answers will be grouped with other answers and there will be no way to identify you (no name, address, or other identifying information).

How does this impact your health?

The project seeks to improve your care - and your health - by asking questions that help us connect you to services, such as First Nations & Métis Health Navigators and Cultural Support Workers. We also know that sometimes people experience discrimination in healthcare, which can have a negative effect on your health. We want to make sure that is not happening here – and, if it is, we want to correct that.

WHY ALL THE QUESTIONS?

By asking if you self-identify as First Nations or Métis, our goal is to make sure every person has access to the highest quality of health care that we can provide. The information you share with us will:

- help us connect you with services, such as First Nations & Métis Health Navigators and Cultural Support Workers
- help us plan for services
- help us improve the quality of care for all

You can choose not to answer this question.

Please ask to speak with the Registration Manager or contact First Nations & Métis Health Services (306-655-0518) if you have any questions or concerns.

- COMMUNITY ACTION PLAN
- RESOURCES ▾
- ACT NOW! ▾

COMMUNITY ACTION PLAN

Our Goal

The Partnership's main goal is to develop, implement and evaluate a Saskatoon Community Action Plan that:

- reflects broad input and commitment from the community;
- represents a broadened response from the community on poverty reduction;
- reports on actions-to-date in key poverty reduction areas;
- articulates common set of priority actions to be taken based on gaps; and
- outlines a plan for ongoing monitoring and evaluation of community progress in reducing poverty.

Saskatoon Community Action Plan to Reduce Poverty

The Saskatoon Community Action Plan will represent a synthesis of what we've heard from the community—where there is support and agreement, where there are questions or concerns, and where there are gaps between intention and action to reduce poverty. It will put forward a starting place for action, based on where we are seeing common ground. The action plan will include:

BILL HOLDEN ET AL (2009). POLICY REDUCTION POLICIES AND PROGRAMS SASKATCHEWAN. CANADIAN COUNCIL ON SOCIAL DEVELOPMENT

“What is missing [in Saskatchewan] at this point in history is a common, comprehensive plan to provide focus for the effort to eliminate poverty. Innovative research, organizations, programming and collaboration at the local level could be tied into a provincial plan to address poverty that would include specific targets and monitor progress over the long term. The time for Saskatchewan to address this problem has come, a time to harness the knowledge and commitment of all the actors involved in the issue, to ensure that the thriving provincial economy works toward a better future for all Saskatchewan citizens.”

Advisory Group on Poverty Reduction

- Composition
 - 11 members: 5 from across government and six from the community
 - Recommended Vision: “We envision all of Saskatchewan committing to actions that will reduce, and ultimately eliminate, poverty in our communities”
 - Recommended Target: “Using the 2012 Market Basket Measure, the Province aims to reduce poverty in Saskatchewan by 50% by the end of 2020”

All Cause Mortality by Deprivation Quintile in Saskatchewan

Figure 3. Percent of the population without a high school education by deprivation quintile in Saskatchewan between 1976 and 2011 estimated using data from the Survey of Labour and Income Dynamics.

High Inequality (measured using ALCC)				
		DRD & DRR Change		
		Decrease	No change	Increase
Prevalence	Increase	Diabetes Food Security		Self-rated Mental Health COPD
	Decrease	Injury		
Moderate Inequality (measured using ALCC)				
		DRD & DRR Change		
		Decrease	No change	Increase
Prevalence	Increase	Chronic Stress		Self-rated Health
	Decrease	CHF Fruit and Vegetable Consumption		
Low Inequality (measured using ALCC)				
		DRD & DRR Change		
		Decrease	No change	Increase
Prevalence	Increase	Mood Disorder Mental Disorder		Mortality
	Decrease	Asthma CAD	Smoking	

Table 2. High, moderate, and low inequality measured using the area level concentration coefficient by prevalence, by change in disparity rate ratio and disparity rate difference.

Recommendations

- 6 areas for initial focus:
 - Income Security
 - Housing and homelessness
 - Early Childhood Development
 - Education and Training
 - Employment
 - Health and Food Security

ADVISORY GROUP ON POVERTY REDUCTION

Saskatchewan Poverty Reduction Strategy

- Government announced a poverty reduction strategy based on these recommendations in March 2016 during the provincial election.
- Results? Stay tuned! Continued monitoring of this data and the impacts of implemented policy decisions promised by the SPRP and researchers.

Canadian Population Health Initiative & Urban Public Health Network partnership

Reducing Gaps in Health - 2008

Data communication lessons

- Same methodology used for all member cities
- Central spokesperson for national media, but simultaneous local media interviews by all member MHOs across the country on same day
- Still one of the most accessed national reports from CPHI ever.
- Served as catalyst for many more cities' work on health equity

National health inequalities data communication examples from Canada

- Public Health Agency of Canada: 1st national report on health inequalities post Rio declaration (www.phac-aspc.gc.ca)
 - 60+ indicators, crosssectional analysis by 20+ stratifiers. National level only, several measures of inequality: due fall 2016
- Canadian Institute for Health Information (www.cihi.ca)
 - 17 indicators by income quintile and gender, national and regional/provincial, trend over 5 to 10 years, several measures of inequality
- Researcher reports and interagency studies
 - More in depth analysis of specific topics for various levels of geography
 - E.g. Canadian Council on the SDOH (www.ccsdh.ca)
 - “Communicating the Social Determinants of Health”
 - “Maps to Inform Intersectoral Planning and Action”, and others

Evidence of the problem: the Pan-Canadian Health Inequalities Reporting Initiative

Brings together data
for **more than 70**
health indicators...

...disaggregated by
each of **13 social**
stratifiers
meaningful to
health equity

The Health Inequalities Data Cube

- Interactive data tables for all available indicators and stratifiers
 - Allows users to rapidly access health inequalities data by topic and population of interest
 - Most data available at both the national and sub-national levels

The screenshot shows the official website of the Health Inequalities Data Cube. At the top, there is a navigation bar with the Government of Canada logo and bilingual text. Below this is a search bar and a menu with categories like Jobs, Immigration, Travel, Business, Benefits, Health, Taxes, and More services. The main content area is titled 'Health Inequalities Data Cube' and includes an introductory paragraph about health inequalities, a section on the 2012 WHO declaration, and a 'Map of Available Indicators' which is a tree diagram showing the hierarchy of data domains. Below this, there are sections for 'More Information' and 'Health Status' with a list of indicators. At the bottom, there is a table with columns for Indicator, Details, Source (Year), Method of Calculation, and Available Stratifiers. The table shows data for 'Children vulnerable in areas of early development'.

Health Inequalities Data Cube

Health inequalities refer to differences in health status between groups in society. These differences can be due to biological factors, individual choices, or chance, but public health evidence suggests that many are attributable to the unequal distribution of the social and economic factors that influence health (e.g. income, education, employment, social supports) and exposure to societal conditions and environments largely beyond the control of the individuals concerned.

In 2012, Canada, along with other World Health Organization (WHO) Member States, endorsed the [Rio Political Declaration on Social Determinants of Health](#), pledging to take action to promote health equity (defined by the WHO as "the absence of avoidable or remediable differences among groups of people"). Strengthening the capacity to monitor and report on health inequalities was recognized as a critical foundation for achieving meaningful progress towards this goal.

The Health Inequalities Data Cube supports Canada's pledges under the Rio Declaration. This resource is a collaborative effort of the Public Health Agency of Canada, the Pan-Canadian Public Health Network (PHN), Statistics Canada, and the Canadian Institute for Health Information, and builds on a [set of indicators of health inequalities](#) proposed by the PHN in 2010.

The Health Inequalities Data Cube contains data on indicators of health status and health determinants, stratified by a range of social and economic characteristics (i.e. social stratifiers) meaningful to health equity. Indicators are grouped into twelve domains.

Map of Available Indicators

[Use the Health Inequalities Data Cube](#)

More Information

For more information about each indicator, click on the domains below:

Health Status

- ☐ Mortality and Life Expectancy
- ☐ Morbidity
- ☐ Mental Health / Suicide
- ☐ Self-Assessed Physical and Mental Health
- ☐ Disease / Health Condition

Health Determinants

- ☐ Health Behaviours
- ☐ Physical and Social Environment
- ☐ Working Conditions
- ☐ Health Care
- ☐ Social Protection
- ☐ Social Inequities
- ☐ Early Childhood Development

Indicator	Details	Source (Year)	Method of Calculation	Available Stratifiers
Children vulnerable in areas of early development	Data not yet available.	Data not yet available.	Data not yet available.	Details

Health inequalities data to support policy and planning

- Access to data and related reporting products can strengthen action on health inequalities by addressing three questions:

1

For a given health issue, where are the greatest inequalities?

E.g.

Indicators for **mental health and illness** can help to assess whether inequalities are most pronounced by income, ethnicity/racial background, Indigenous identity, sexual orientation, age, etc.

2

For which health issue(s) do vulnerable populations experience the greatest inequalities?

E.g.

Examining inequalities data for **Indigenous peoples** or **children** (or visible minority groups, LGBT communities, etc.) can help to direct program and research resources to the health issues for which they experience the most disproportionate risk

3

How can public health research, programs and services better address health inequalities?

E.g.

Access to data can facilitate health equity integration by:

- Improving **policy, program, and planning** decisions
- Prioritizing **science, intervention research, and surveillance** investments
- Supporting **program evaluation**, including relevance and effectiveness for vulnerable populations
- Enabling **monitoring of progress** in reducing health inequalities

How evidence can facilitate targeted decision-making on health issues

SOCIAL STRATIFIERS:		Alcohol use	Arthritis	Asthma	Breast-feeding, exclusive	Breast-feeding, initiation	Colo-rectal screen	Contact with a medical doctor	Diabetes	Food insecurity	Fruit & vegetable consumption	Functional health impairment	Mammo-graphy screen	Obesity	Oral health, no ability to chew	Oral health, pain / discomfort	Over-weight	Pap smear screen	Perceived health, fair/ poor	Perceived mental health, fair/ poor	Physical activity	Second-hand smoke, home	Second-hand smoke, vehicles/ public	Sense of community belonging	Smoking	Visit with dentist/ ortho-dontist	Work-place stress

Evidence of what works: equity-sensitive interventions

- Consolidates multiple sources of information to offer a “one stop shop” for health professionals and decision-makers about how to promote health and prevent chronic disease

- A key feature is its searchable database of interventions that have been identified as:
 - Best or promising practices
 - Aboriginal Ways Tried and True
 - NEW! Equity-sensitive interventions

TOWARD HEALTH EQUITY: A Practice Tool (condensed)

Trends in Health Inequality - 2015

CIHI report – Nov 2015

Figure 7: Individual After-Tax Income Inequality Measures (2011 Constant Canadian Dollars), Canada, 1976 to 2011

CIHI report 2015

Figure 35: Smoking Prevalence Rates, by Income Quintile, Canada, 2003 to 2013

Communicating on the SDOH

(CCSDH report)

- A report on general communications strategies to use for effective communications on the social determinants of health with the public and various audiences
- Similar work from the USA funded by Robert Wood Johnson Foundation
- Also discusses ways to talk about SDOH to various audiences across various spectrums (age, gender, political ideology, public vs private sector etc) by focusing on deep metaphors in your society.

Communication on the SDOH

WHAT TO DO	WHAT TO AVOID:
Use clear, plain language	Technical language or jargon
Make issues tangible with analogies and stories	Abstract concepts or terms
Break down and round numbers; place numbers in context	Complex numbers, or large numbers without any context
Challenge conventional wisdom with one unexpected fact	Exhaustive documentation
Use inclusive language (we, our, us)	Creating distance between groups (them, they)
Identify people by shared experiences	Labeling people by group membership
Prime your audience with a fact, image or story they are likely to believe, based on their values, interests and needs	Facts, images or stories that audiences may find too contentious or extreme to be believable (even if they are true)
Leave the audience with a memorable story or fact that can be easily repeated	Being forgettable
Use a conversational and familiar tone	A clinical or academic tone
Understand your audience—this includes customizing your message by selecting appropriate tools, approaches and information	Assuming the same message will work for all audiences
Prepare your content and presentation	Speaking off the cuff
Focus on communicating one thing at a time	Trying to do too many things at once

Examples

- Politicians:
 - “Elevator pitches”, public opinion polls, briefing notes, small area data and maps of their constituency
- Health System Decision-makers:
 - Drill-down health status reports, infographics; health equity audits, health equity gauge; integration into quality improvement & performance monitoring; position statement
- Public:
 - Media campaigns (build from education about effects of poverty/SDOH on health, policy changes that work, costs of status quo and calls for action)

What will you do?

- Small group exercise

Collaborators
